KaiPay

AI-powered agent that automates cross-border stablecoin remittances for migrant workers

The Problem & Our Solution

Migrant workers lose 5-10% to fees and manual transfers. KaiPay's AI agent automates stablecoin remittances with smart, rule-based delivery.

- Traditional remittance services charge high fees and require repetitive manual transfers
- Recipients have little flexibility over how funds are used for bills, savings, or cash
- KaiPay's AI agent sets up recurring, rule-based stablecoin transfers once
- Non-custodial Solana wallet converts local fiat to USDC automatically
- Funds are delivered via Solana Pay directly to a recipient's phone number

How It Works

Senders set rules once; the AI agent handles FX monitoring, conversion, splitting, and delivery via Solana Pay, all from a non-custodial wallet.

- Sender links a non-custodial Solana wallet and sets recurring transfer rules once
- AI agent monitors FX rates and schedules conversions from local fiat to USDC
- Agent splits each transfer across bills, savings, and cash-out per sender rules
- USDC is delivered on-chain via Solana Pay to the recipient's phone number
- SMS/WhatsApp notification stub alerts recipients with no crypto knowledge

Built with

Solana, Solana Pay, Rust/Anchor, USDC, React, Node.js, OpenAI API

Why Now & What's Next

Solana's near-zero fees and fast settlement make AI-automated remittances viable now. Next: real on/off-ramps and a diaspora pilot.

- Stablecoin remittance volume on Solana is growing due to low fees and fast settlement
- AI automation of recurring transfers is newly viable at this scale and cost
- Next: partner with a local fiat on/off-ramp provider for real payouts
- Next: add multi-currency support and a recipient-side cash-out network
- Next: launch a pilot with a diaspora community for real remittance flows
